#### 1 Introduction

The **doBy** package contains a variety of utility functions. This working document describes some of these functions. The package originally grew out of a need to calculate groupwise summary statistics (much in the spirit of PROC SUMMARY of the SAS system), but today the package contains many different utilities.

#### 2 Data used for illustration

The description of the doBy package is based on the following datasets.

CO2 data The CO2 data frame comes from an experiment on the cold tolerance of the grass species *Echinochloa crus-galli*. To limit the amount of output we modify names and levels of variables as follows

```
data(CO2)
CO2 <- transform(CO2, Treat=Treatment, Treatment=NULL)
levels(CO2$Treat) <- c("nchil","chil")
levels(CO2$Type) <- c("Que","Mis")
CO2 <- subset(CO2, Plant %in% c("Qn1", "Qc1", "Mn1", "Mc1"))</pre>
```

Airquality data The airquality dataset contains air quality measurements in New York, May to September 1973. The months are coded as  $5, \ldots, 9$ . To limit the output we only consider data for two months:

```
airquality <- subset(airquality, Month %in% c(5,6))
```

**Dietox data** The dietox data are provided in the doBy package and result from a study of the effect of adding vitamin E and/or copper to the feed of slaughter pigs.

## 3 Working with groupwise data

#### 3.1 The summaryBy function

The summaryBy function is used for calculating quantities like "the mean and variance of numerical variables x and y for each combination of two factors A and B". Notice: A functionality similar to summaryBy is provided by aggregate() from base R.

```
myfun1 <- function(x){c(m=mean(x), s=sd(x))}</pre>
 summaryBy(cbind(conc, uptake, lu=log(uptake)) ~ Plant,
            data=CO2, FUN=myfun1)
  Plant conc.m conc.s uptake.m uptake.s lu.m
1
    Qn1
           435
                317.7
                          33.23
                                    8.215 3.467 0.3189
2
    Qc1
           435
                317.7
                          29.97
                                    8.335 3.356 0.3446
                317.7
    Mn1
           435
                          26.40
                                    8.694 3.209 0.4234
    Mc1
           435
                317.7
                          18.00
                                   4.119 2.864 0.2622
A simpler call is
```

summaryBy(conc ~ Plant, data=CO2, FUN=mean)

Instead of formula we may specify a list containing the left hand side and the right hand side of a formula<sup>1</sup> but that is possible only for variables already in the dataframe:

### 3.2 The orderBy function

Ordering (or sorting) a data frame is possible with the orderBy function. Suppose we want to order the rows of the the airquality data by Temp and by Month (within Temp). This can be achieved by:

```
x1 <- orderBy(~ Temp + Month, data=airquality)
head(x1)</pre>
```

<sup>&</sup>lt;sup>1</sup>This is a feature of summaryBy and it does not work with aggregate.

```
Ozone Solar. R Wind Temp Month Day

                          56
       6
                                 5
               78 18.4
                          57
                                    18
18
25
      NA
               66 16.6
                          57
                                 5 25
                                 5 27
27
      NA
               NA 8.0
                          57
15
      18
               65 13.2
                          58
                                 5
                                    15
26
              266 14.9
                                 5
      NA
                          58
                                    26
```

If we want the ordering to be by decreasing values of one of the variables, we can do

```
x2 <- orderBy(~ - Temp + Month, data=airquality)
An alternative form is:
x3 <- orderBy(c("Temp", "Month"), data=airquality)
x4 <- orderBy(c("-Temp", "Month"), data=airquality)</pre>
```

#### 3.3 The splitBy function

Suppose we want to split the airquality data into a list of dataframes, e.g. one dataframe for each month. This can be achieved by:

```
x <- splitBy(~ Month, data=airquality)</pre>
 lapply(x, head, 4)

$class
 [1] "splitByData" "list"
An alternative call is
    splitBy("Month", data=airquality)
```

#### 3.4 The subsetBy function

Suppose we want to select those rows within each month for which the the wind speed is larger than the mean wind speed (within the month). This is achieved by:

```
x \leftarrow subsetBy(~Month, subset=Wind > mean(Wind), data=airquality)
head(x)
```

```
Ozone Solar.R Wind Temp Month Day
5.3
        12
                149 12.6
                                    5
                                        3
                            74
5.5
        NA
                 NA 14.3
                            56
                                   5
                                        5
                 NA 14.9
                                   5
5.6
        28
                            66
                                        6
                 99 13.8
                                   5
5.8
        19
                            59
                                        8
5.9
         8
                 19 20.1
                            61
                                   5
                                        9
5.15
        18
                 65 13.2
                            58
                                   5 15
```

Note that the statement Wind > mean(Wind) is evaluated within each month.

#### 3.5 The transformBy function

The transformBy function is analogous to the transform function except that it works within groups. For example:

```
x <- transformBy(~Month, data=airquality,</pre>
                   minW=min(Wind), maxW=max(Wind),
                   chg = diff(range(Wind)))
 head(x)
    Ozone Solar.R Wind Temp Month Day minW maxW chg
              190 7.4
5.1
       41
                          67
                                 5
                                     1
                                        5.7 20.1 14.4
                                     2 5.7 20.1 14.4
5.2
       36
              118 8.0
                          72
                                 5
5.3
       12
              149 12.6
                          74
                                 5
                                    3 5.7 20.1 14.4
                                    4 5.7 20.1 14.4
5.4
       18
              313 11.5
                          62
                                 5
                                    5 5.7 20.1 14.4
5.5
       NA
               NA 14.3
                          56
                                 5
5.6
       28
               NA 14.9
                          66
                                     6 5.7 20.1 14.4
Alternative forms:
 x <- transformBy("Month", data=airquality,</pre>
                   minW=min(Wind), maxW=max(Wind),
                   chg = diff(range(Wind)))
```

#### 4 Miscellaneous

#### 4.1 Specialize

```
ff <- function(a, b=2, c=4){a + b + c}
ff1 <- specialize(ff, arglist=list(a=1, b=7, yy=123))
ff1

function (c = 4)
{
    1 + 7 + c
}
<environment: 0x8412f00>
    gg <- rnorm
    gg1 <- specialize(gg, list(n=10))
    gg1</pre>
```

```
function (mean = 0, sd = 1)
.Call(C_rnorm, 10, mean, sd)
<environment: 0x83da8a0>

Notice that this result is absurd:
  f <- function(a) {a <- a + 1; a}
  f1 <- specialize(f, list(a = 10))
  f1

function ()
{
    10 <- 10 + 1
    10
}
<environment: 0x8371880>
```

#### 4.2 The firstobs() / lastobs() function

To obtain the indices of the first/last occurrences of an item in a vector do:

```
x <- c(1,1,1,2,2,2,1,1,1,3)
firstobs(x)
[1] 1 4 10
lastobs(x)
[1] 6 9 10
The same can be done on a data frame, e.g.
firstobs(~Plant, data=CO2)
[1] 1 8 15 22

#### 4.3 The which.maxn() and which.minn() functions

The location of the n largest / smallest entries in a numeric vector can be obtained with

```
x <- c(1:4,0:5,11,NA,NA) which.maxn(x,3)
```

```
[1] 11 10 4
 which.minn(x,5)
[1] 5 1 6 2 7
      Subsequences - subSeq()
4.4

#### 4.7 Time since an event - timeSinceEvent()

```
Consider the vector
```

Imagine that "1" indicates an event of some kind which takes place at a certain time point. By default time points are assumed equidistant but for illustration we define time time variable

```
tvar \leftarrow seq\_along(yvar) + c(0.1,0.2)
```

#### Now we find time since event as

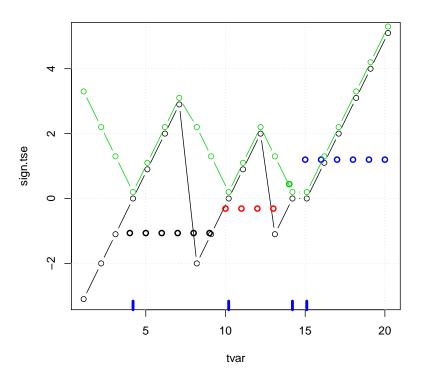

#### tse<- timeSinceEvent(yvar,tvar)</pre>

```
yvar tvar abs.tse sign.tse ewin run tae

                   5.1
                             5.1
                                                   NA
```

The output reads as follows:

- abs.tse: Absolute time since (nearest) event.
- sign.tse: Signed time since (nearest) event.
- ewin: Event window: Gives a symmetric window around each event.
- run: The value of run is set to 1 when the first event occurs and is increased by 1 at each subsequent event.
- tae: Time after event.
- tbe: Time before event.

```
plot(sign.tse~tvar, data=tse, type="b")
grid()
rug(tse$tvar[tse$yvar==1], col="blue",lwd=4)
points(scale(tse$run), col=tse$run, lwd=2)
lines(abs.tse+.2~tvar, data=tse, type="b",col=3)
```

plot(tae~tvar, data=tse, ylim=c(-6,6),type="b")
grid()
lines(tbe~tvar, data=tse, type="b", col="red")
rug(tse\$tvar[tse\$yvar==1], col="blue",lwd=4)
lines(run~tvar, data=tse, col="cyan",lwd=2)

plot(ewin~tvar, data=tse,ylim=c(1,4))
rug(tse\$tvar[tse\$yvar==1], col="blue",lwd=4)
grid()
lines(run~tvar, data=tse,col="red")

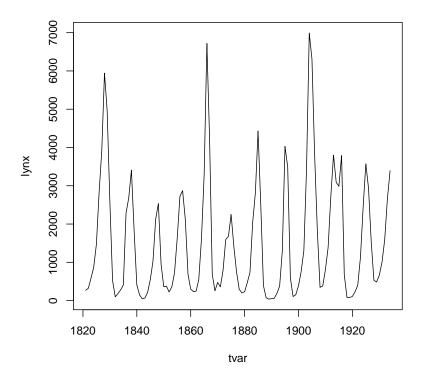

We may now find times for which time since an event is at most 1 as tse\$tvar[tse\$abs<=1]

[1] 4.2 5.1 10.2 11.1 14.2 15.1

# 4.8 Example: Using subSeq() and timeSinceEvent()

Consider the lynx data:

```
lynx <- as.numeric(lynx)
tvar <- 1821:1934
plot(tvar,lynx,type="l")</pre>
```

Suppose we want to estimate the cycle lengths. One way of doing this is as follows:

```
yyy <- lynx>mean(lynx)
 head(yyy)
[1] FALSE FALSE FALSE FALSE
                                      TRUE
 sss <- subSeq(yyy,TRUE)</pre>

                                                 2
                                                    -8
```

We get two different (not that different) estimates of period lengths:

```
len1 <- tapply(tse$ewin, tse$ewin, length)</pre>
             5
                6
                   7 8
                          9 10 11 12
13 10
      9
          9
             9
                9 11 10 9 10 10
 len2 <- tapply(tse$run, tse$run, length)</pre>
                       8
             5 6 7
                          9 10 11 12
10 10
       9
          9 8 11 11
                       9
                          9 11
                                8
 c(median(len1),median(len2),mean(len1),mean(len2))
[1] 9.500 9.000 9.500 8.917
We can overlay the cycles as:
tse$lynx <- lynx
 tse2 <- na.omit(tse)</pre>
 plot(lynx~tae, data=tse2)
```

plot(tvar,lynx,type="1",lty=2)
mm <- lm(lynx~tae+I(tae^2)+I(tae^3), data=tse2)
lines(fitted(mm)~tvar, data=tse2, col="red")</pre>
